

Q1. Total Sales Generated by the Business

Business Question:

What is the total sales generated by the business?

What I Did:

Used the `SUM` formula on the Sales column to calculate total revenue generated from all orders.

Observation:

The business generated **₹23,26,534.35** in total sales.

Insight:

The company processed strong revenue volume, indicating healthy overall sales activity across products and customers.

Business Meaning / Recommendation:

Total sales acts as a top-level performance KPI and helps leadership understand the overall scale of business activity. However, sales should be evaluated alongside profit to determine whether revenue is actually converting into business value.

Q2. Total Profit Generated by the Business

Business Question:

What is the total profit generated by the business?

What I Did:

Used the `SUM` formula on the Profit column to calculate total profit earned after costs and discounts.

Observation:

The business generated **₹2,92,296.81** in total profit.

Insight:

Although sales are high, only a portion converts into profit, showing the importance of margin management and cost control.

Business Meaning / Recommendation:

Profit reflects real business value after expenses. Decision-makers should focus not only on increasing revenue but also on improving profitability through better pricing, cost optimization, and margin control.

Q3. Total Orders Placed

Business Question:

How many total orders were placed?

What I Did:

Used the `COUNTA` formula on the Order ID column to count the total number of orders placed.

Observation:

The business processed **10,194 total orders**.

Insight:

A high number of orders indicates strong customer demand and business activity.

Business Meaning / Recommendation:

Tracking total orders helps measure business growth and operational scale. However, order volume alone should not define success — businesses must ensure that orders contribute positively to revenue and profit.

Q4. Average Revenue per Order (AOV)

Business Question:

How much revenue does one order generate on average?

What I Did:

Calculated Average Order Value (AOV) by dividing total sales by total orders using the formula:

`SUM(Sales) / Total Orders`

Observation:

On average, each order generated **₹228.23** in revenue.

Insight:

The business earns a moderate amount per transaction, but growth may depend on increasing customer spend per order.

Business Meaning / Recommendation:

Improving AOV through product bundling, upselling, premium product promotion, or smarter pricing strategies can significantly increase revenue without requiring more customers.

Q5. Furniture Category Sales Contribution

Business Question:

How much sales revenue comes from the Furniture category?

What I Did:

Used the `SUMIF` formula to calculate total sales revenue generated from the Furniture category.

Observation:

The Furniture category generated **₹7,54,747.76** in sales revenue.

Insight:

Furniture contributes significantly to total business revenue, making it an important product category.

Business Meaning / Recommendation:

Since Furniture contributes meaningful revenue, the business should also evaluate its profitability and margins to ensure strong sales are translating into business value rather than revenue without profit.

Q6. Technology Category Profit Contribution

Business Question:

How much profit is generated from the Technology category?

What I Did:

Used the `SUMIF` formula to calculate total profit generated from the Technology category.

Observation:

The Technology category generated **₹1,46,543.38** in total profit.

Insight:

Technology contributes strong profit to the business, indicating healthy margins and good revenue-to-profit conversion.

Business Meaning / Recommendation:

Since Technology is a strong profit contributor, the business should continue investing in high-performing products within this category while identifying opportunities to further improve sales and margins.

Q7. West Region Sales Contribution

Business Question:

How much sales revenue is generated from the West region?

What I Did:

Used the `SUMIF` formula to calculate total sales revenue generated from customers in the West region.

Observation:

The West region generated **₹7,39,813.61** in sales revenue.

Insight:

The West region contributes significantly to total business revenue, suggesting strong customer demand and market presence in this region.

Business Meaning / Recommendation:

High-performing regions like the West should be prioritized for customer retention, marketing efforts, and inventory planning. At the same time, lower-performing regions should be analyzed to understand performance gaps.

Q8. Technology Sales in the West Region

Business Question:

How much sales revenue is generated from the Technology category in the West region?

What I Did:

Used the `SUMIFS` formula to calculate sales revenue by applying multiple conditions: **Region = West** and **Category = Technology**.

Observation:

Technology products in the West region generated **₹2,52,766.99** in sales revenue.

Insight:

The combination of Technology products and the West region contributes meaningful revenue, indicating a strong product-region fit.

Business Meaning / Recommendation:

The business can focus more marketing, promotions, and inventory planning on high-performing region-category combinations to maximize revenue and strengthen market performance.

Q9. Loss-Making Orders

Business Question:

How many orders resulted in a loss?

What I Did:

Used the `COUNTIF` formula on the profit/loss flag column to count orders categorized as **Loss**.

Observation:

A total of **1,901 orders** generated negative profit.

Insight:

A noticeable number of orders are contributing negatively to profitability, suggesting pricing, discounting, or cost-related inefficiencies.

Business Meaning / Recommendation:

The business should investigate why certain orders are loss-making by reviewing discounts, delivery costs, product mix, or return patterns. Reducing loss-making orders can improve profitability without necessarily increasing sales volume.

Q10. Consumer Segment Order Volume

Business Question:

How many orders belong to the Consumer segment?

What I Did:

Used the `COUNTIF` formula to count total orders belonging to the **Consumer** customer segment.

Observation:

The Consumer segment placed **5,281 orders**.

Insight:

The Consumer segment contributes a large share of total order volume, making it an important customer segment for the business.

Business Meaning / Recommendation:

Since the Consumer segment drives significant order activity, the business should focus on customer retention, satisfaction, and targeted promotions while also ensuring this segment contributes positively to profit and not just sales volume.

Q11. Consumer Segment Orders in the West Region

Business Question:

How many orders come from the Consumer segment in the West region?

What I Did:

Used the `COUNTIFS` formula by applying multiple conditions: **Segment = Consumer** and **Region = West** to count total orders.

Observation:

The Consumer segment in the West region placed **1,690 orders**.

Insight:

The Consumer segment contributes strong order volume within the West region, indicating healthy customer activity in this market.

Business Meaning / Recommendation:

Since Consumer customers in the West region contribute meaningful order volume, the business should focus on targeted promotions, customer retention, and personalized offers to strengthen performance while ensuring these orders remain profitable.

Q12. Average Profit Generated by the Technology Category

Business Question:

What is the average profit generated by the Technology category?

What I Did:

Used the `AVERAGEIF` formula to calculate the average profit of orders belonging to the **Technology** category.

Observation:

Technology products generated an average profit of **₹78.58** per order.

Insight:

Technology products show healthy average profitability, indicating stronger margins compared to categories that may struggle to convert sales into profit.

Business Meaning / Recommendation:

A profitable category like Technology should be monitored and scaled strategically through better product availability, targeted marketing, and customer acquisition while maintaining healthy margins.

Q13. Average Discount Given in the Furniture Category

Business Question:

What is the average discount given in the Furniture category?

What I Did:

Used the `AVERAGEIF` formula to calculate the average discount percentage applied to products in the **Furniture** category.

Observation:

Furniture products received an average discount of **17.30%**.

Insight:

Furniture products appear to rely on discounting to drive sales, which may negatively affect overall profitability if margins are already limited.

Business Meaning / Recommendation:

The business should review whether discount levels in Furniture are sustainable. Reducing unnecessary discounts, optimizing pricing, or promoting higher-margin products can help improve profitability without reducing revenue.

Q14. Total Returned Orders

Business Question:

How many orders were returned by customers?

What I Did:

Used the `COUNTA` formula on the Returns dataset to count the total number of returned orders.

Observation:

A total of **296 orders** were returned by customers.

Insight:

Returned orders represent potential revenue leakage and may indicate customer dissatisfaction, product quality issues, or fulfillment problems.

Business Meaning / Recommendation:

The business should investigate return drivers such as damaged products, incorrect deliveries, pricing expectations, or poor product fit. Reducing returns can improve both profitability and customer satisfaction.

Q15. Returned Order Lookup

Business Question:

Was a sample order returned or not?

What I Did:

Used the `VLOOKUP` formula to search a sample order ID in the Returns table and identify whether the order was returned.

Observation:

The selected sample order was marked as **Returned (Yes)**.

Insight:

Lookup functions help quickly identify return status for individual orders, making customer issue tracking and operational analysis easier.

Business Meaning / Recommendation:

Order-level return tracking helps businesses investigate customer complaints, analyze repeat return patterns, and improve after-sales service. It also supports faster issue resolution and better customer experience.

Q16. High-Value Order Classification

Business Question:

Is an order a high-value order or a normal order based on sales amount?

What I Did:

Used the `IF` formula to classify orders based on sales amount. Orders with sales greater than ₹500 were labeled as **High Value**, otherwise **Normal**.

Observation:

The selected sample order was classified as a **Normal order**.

Insight:

Order classification helps separate premium or high-revenue transactions from regular purchases, making customer and revenue segmentation easier.

Business Meaning / Recommendation:

Identifying high-value orders helps businesses target premium customers with loyalty programs, personalized offers, or better service while understanding which customer groups drive stronger revenue.

Q17. Healthy Profit vs Low Profit Classification

Business Question:

Does an order have healthy profit or low profit based on profit amount?

What I Did:

Used the `IF` formula to classify orders by comparing profit against the average profit benchmark. Orders above average profit were labeled **Healthy**, otherwise **Low**.

Observation:

The selected sample order was classified as **Low profit**.

Insight:

Not all orders contribute equally to profitability. Some generate sales but perform weakly in terms of margin or profit contribution.

Business Meaning / Recommendation:

Classifying orders by profit performance helps businesses identify weak-margin transactions and investigate causes such as discounts, product mix, or operational costs. Improving low-profit orders can strengthen overall profitability.

Q18. Product with the Highest Sales Revenue

Business Question:

Which product generated the highest sales revenue?

What I Did:

Used the `MAX` function to identify the highest sales value and combined it with `INDEX + MATCH` to retrieve the corresponding product name.

Observation:

Machines generated the highest sales revenue.

Insight:

Certain products contribute disproportionately to overall revenue, indicating stronger customer demand or higher transaction value.

Business Meaning / Recommendation:

High-performing products should receive focused inventory planning, promotion, and availability management to avoid stock shortages and maximize revenue opportunities.

Q19. Customer with the Highest Sales Revenue

Business Question:

Which customer generated the highest sales revenue?

What I Did:

Used the `MAX` function to identify the highest customer sales value and applied `INDEX` + `MATCH` to retrieve the customer name.

Observation:

Sean Miller generated the highest total sales revenue.

Insight:

A small group of customers may contribute disproportionately to business revenue, making them strategically valuable.

Business Meaning / Recommendation:

High-value customers should be retained through personalized engagement, loyalty benefits, and strong customer support. However, revenue contribution should also be reviewed alongside profitability to ensure these customers generate sustainable business value.

Q20. Category with the Highest Total Profit

Business Question:

Which category generated the highest total profit?

What I Did:

Used the `SUMIF` formula to compare profit generated across categories and identify the highest profit contributor.

Observation:

The **Technology** category generated the highest total profit.

Insight:

Technology converts sales into profit more effectively than other categories, suggesting stronger margins or better pricing efficiency.

Business Meaning / Recommendation:

The business should prioritize profitable categories like Technology through stronger inventory planning, product expansion, and targeted marketing while studying weaker categories to improve margin performance.
